

# Comparing Perturbed Optimizer and Barrier Function Method for Differentiating Linear Programs

Mingrui Zhao

Supervised by: Prof. Stephen Gould

28 Oct 2021

# Table of Contents

## 1 Introduction

## 2 Theoretical Background

- Barrier Function Method
- Perturbed Optimiser

## 3 Results

- Differentiating Toy LP
- Back Propagation through LP Declarative Node
- Trainability of LP declarative node on CIFAR10

## 4 Conclusion & Future Works

# Table of Contents

## 1 Introduction

## 2 Theoretical Background

- Barrier Function Method
- Perturbed Optimiser

## 3 Results

- Differentiating Toy LP
- Back Propagation through LP Declarative Node
- Trainability of LP declarative node on CIFAR10

## 4 Conclusion & Future Works

# Deep Learning

- Applied in image classification, voice recognition and so much more.
- Core of deep learning: Artificial Neural Networks.
  - Directed graph of parametrised processing nodes [1]

Figure: A conceptual sketch of a neural network

# Deep Learning

- Learning: Tune node parameters
- Done through back propagation
- Require node gradient

Figure: Conceptual sketch of back propagation of a neural network

# Declarative Nodes

Figure: Imperative Node [1]

Figure: Declarative Node [1]

- All imperative nodes can be expressed as declarative nodes
- Declarative node has functions beyond the capability of imperative nodes, such as hard-code constraints into nodes.

# Linear Program (LP)

- Declarative node fails on Linear Program

## Definition

Optimisation problem with **linear** objective function and constraints.  
The canonical form of a Linear Program is

$$\begin{aligned} & \text{minimize } c^T x \\ & \text{subject to } Ax \preceq b \end{aligned}$$

where  $c, x \in \mathbb{R}^n$ ,  $A \in \mathbb{R}^{m \times n}$ ,  $b \in \mathbb{R}^m$

- The solution to a Linear Program always lies on a vertex of its feasible region

## Toy Example

$$\begin{aligned}
 &\text{minimize} && \theta x_1 - 4x_2 \\
 &\text{subject to} && x_1 + x_2 \leq 30 \\
 &&& x_2 \geq 0, x_1 \geq 1
 \end{aligned} \tag{1}$$

Figure: Feasible region

Figure: Solution of LP versus  $\theta$

A constant zero gradient defects back propagation, hence model training

Figure: Solution of LP versus  $\theta$

Figure: Gradient of solution versus  $\theta$

Barrier function method v.s. Perturbed optimizer method

# Table of Contents

## 1 Introduction

## 2 Theoretical Background

- Barrier Function Method
- Perturbed Optimiser

## 3 Results

- Differentiating Toy LP
- Back Propagation through LP Declarative Node
- Trainability of LP declarative node on CIFAR10

## 4 Conclusion & Future Works

# Barrier Function Method

Combine constraints functions with the objective function through log barrier function.

## Definition

Consider the optimisation problem

$$\begin{array}{ll}\text{minimize} & c^T x \\ \text{subject to} & Ax \preceq b\end{array}$$

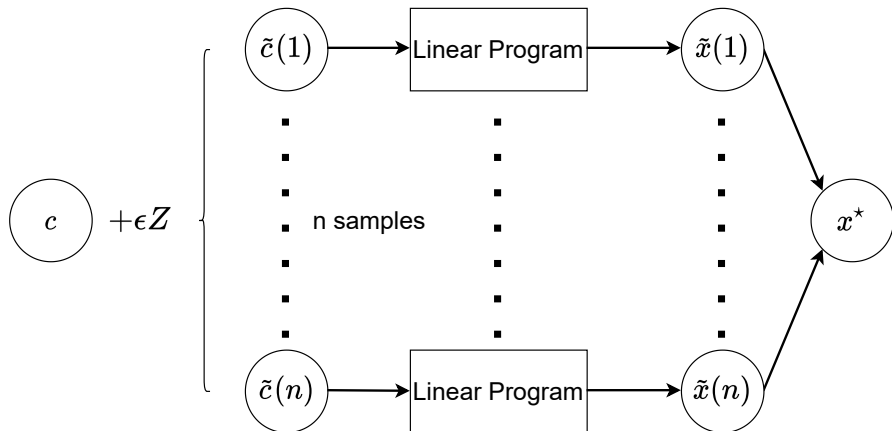

Applying barrier function method transforms this LP to an unconstrained optimisation problem

$$\text{minimize} \quad tc^T x - \sum_{i=1}^m \log(b_i - a_i^T x)$$

where  $a_i^T$  is the  $i_{th}$  row of  $A$

$$\frac{\partial x}{\partial c} = -D_{xx}^{-1} f(x, c) D_{xc} f(x, c) [1]$$

# Perturbed Optimiser Method

$\frac{\partial x}{\partial c} = \mathbf{E} \left[ x^*(c + \epsilon Z) \nabla_z \nu(Z)^\top / \epsilon \right]$  where  $Z$  is the noise,  $\nu(z)$  is a function defined from noise distribution and  $\epsilon$  is the temperature parameter of noise [2].

# Table of Contents

## 1 Introduction

## 2 Theoretical Background

- Barrier Function Method
- Perturbed Optimiser

## 3 Results

- Differentiating Toy LP
- Back Propagation through LP Declarative Node
- Trainability of LP declarative node on CIFAR10

## 4 Conclusion & Future Works

# Differentiating Toy LP

Recall the toy LP problem shown earlier

## Toy Example

$$\begin{aligned} & \text{minimize} && \theta u_1 - 4u_2 \\ & \text{subject to} && u_1 + u_2 \leq 30 \\ & && u_2 \geq 0, u_1 \geq 1 \end{aligned} \tag{2}$$

Figure: Solution of LP versus  $\theta$

Figure: Gradient of solution versus  $\theta$

# Differentiating Toy LP – Barrier Function Method

$t = 0.5$

Avg. time cost for sol/grad = 0.01s/0.0001s

Figure:  $u$  against  $\theta$

Figure: Gradient of  $u$  against  $\theta$

# Differentiating Toy LP – Perturbed Optimizer Method

$\sigma = 0.7$ , Gumbel Noise, Sample Size = 2,000

Avg. time cost for sol/grad = 14.82s/0.0002s

Figure:  $u$  against  $\theta$

Figure: Gradient of  $u$  against  $\theta$

# Back Propagation through LP Declarative Node

## LP Declarative Node

$$\begin{aligned} & \text{minimize} && c^T x \\ & \text{subject to} && u_1 + u_2 \leq 30 \\ & && u_2 \geq 0, u_1 \geq 1 \end{aligned} \tag{3}$$

Initialise  $c = [-8, -4]$  with  $x^* = [30, 0]$

Aim to update  $c$  with approximated gradient to achieve  $x^* = [1, 29]$

# Back Propagation through LP Declarative Node

## Barrier Function Method

Loss =  $\|\bar{x} - [1, 29]\|_2^2$ , learning rate = 0.01,  $t=0.1$

Figure:  $\bar{x}$  over training iterations

Figure: Log loss of declarative node

# Back Propagation through LP Declarative Node Perturbed Optimizer Method

Loss =  $\|\bar{x} - [1, 29]\|_2^2$ , learning rate = 0.01  
 $\epsilon = 0.5$ , Sample Size = 200, Noise type = Gumbel

Figure:  $\bar{x}$  over training iterations

Figure: Loss of declarative node

# Trainability of LP declarative node on CIFAR10

- CIFAR10: An image dataset contains 10 classes of object
- Initialise a Convolutional Neural Network and embed an LP declarative node.
- Perform Image classification tasks on CIFAR10
- Not aiming for state of the art results, but to demonstrate the ability of incorporating differentiable LP into an end-to-end learnable model.

# Trainability of LP declarative node on CIFAR10

	Original CNN	Plain LP
Mean Average Accuracy	63%	10%

	Perturbed Optimizer	Barrier Function Method
Mean Average Accuracy	30%	N/A

- Proves the trainability of LP declarative node within a complete network
- Barrier function method failed due to limited computational resource
  - Determine the gradient of barrier function method requires inverting a Hessian matrix, in this model the matrix is  $400 \times 400$  in dimension.

# Table of Contents

## 1 Introduction

## 2 Theoretical Background

- Barrier Function Method
- Perturbed Optimiser

## 3 Results

- Differentiating Toy LP
- Back Propagation through LP Declarative Node
- Trainability of LP declarative node on CIFAR10

## 4 Conclusion & Future Works

## Barrier Function Method

- Low computational cost for low dimensional LP
- Exponentially raising computational cost for high dimensional LP
- Deterministic approximation
- Smooth gradient approximation
- Require optimisation problem solver capable for log barrier terms

## Perturbed Optimiser Method

- Computational cost is sample size dependent, generally it is high
- Relatively Lower computational cost for high dimensional LP
- Stochastic approximation
- Non-smooth gradient approximation, can be improved by increasing sample size
- Capable with any solver

- Determine theoretical equivalency between perturbed optimizer and barrier function methods
- Find constructive LP declarative nodes for model training, aim for state of the art results
